Name: Braden Shiew Hao Wen

Monash ID: 33273375

Group: Applied_01_MA_G5

1. Brief Overview

Our group was tasked with the software design of a fun and interactive game designed to make Python programming fun and engaging for young learners called CodeVenture. The software design phase mostly consists of creating diagrams and analysing the requirements from the requirements phase.

2. Individual Breakdown

Tasks and Responsibilities:

Braden (Me) – System Context Analysis, Sequence Diagram for Setting Parental Controls

Sheng Jie – Table of Contents, Use Case Diagram, Sequence Diagram for Parent/Educator Checking Learner Progress

Wei Zheng – System Context Diagram, System Architecture Diagram, Sequence Diagram for Educator Providing Feedback

Vincent – Class Diagram, Sequence Diagram for Usage of Learning Modules

Outcomes:

All members met their goals without much challenge.

3. Collaboration and Team Dynamics

Group meetings: Group meetings were mostly held online via chat. Overall, the group was good at voicing opinions and splitting workload efficiently. It is essentially the same as when we were doing the requirements phase, but our communication has improved.

Tools used for collaboration/communication: For communication, we created a group on Discord. As for collaborating on the project, we created a shared Google Document as well as Lucidchart files for the diagrams and worked together on those files.

4. Self-Assessment

I worked on the ‘System Context Analysis’ and ‘Sequence Diagram for Setting Parental Controls’ sections of the software design document. I completed the tasks relatively easily, but I found myself struggling a little at the ‘System Context Analysis’ section as I struggled to understand the concepts until I did further research regarding it online. Other than that, I had no other issues.

5. Peer Feedback

I have no complaints whatsoever as everyone greatly contributed to the project, completing their tasks without much trouble. There were no issues with communication either and every point got across clearly just as it was when we did the requirements phase.
